

### C-Start® Configuration Form

Please fill out the following pages with your site and configuration information to ensure the most efficient start up of the C-Start. This must be filled out in its entirety for your order to be processed. DRB must receive this form when your order is placed.

Make sure to thoroughly review this form upon completion to ensure no errors have been made. DRB is not responsible for errors submitted on this form. The customer is responsible for reviewing all settings upon installation to ensure the settings are correct.

Please send the completed form to Unitec by fax at 410-579-6830 or email it to [unitecorderentry@drb.com](mailto:unitecorderentry@drb.com).

## C-Start Configuration Form

---

### Order Information:

Distributor Name: \_\_\_\_\_

Distributor PO #: \_\_\_\_\_

Check here if all units on this order will NOT be configured alike (and attach additional configuration forms)

### Site Information:

Site Name: \_\_\_\_\_

Address: \_\_\_\_\_  
Street City State Zip

Site Owner: \_\_\_\_\_  
Name Phone

Wash Equipment  
\* \_\_\_\_\_

\* List the Car Wash equipment manufacturer and model. For conveyor washes, also list the mfr & model of the controller.

### Wash Interface:

There are three types of “Wash-In-Use” handshaking:

- Wash-In-Use (voltage present) – The car wash activates the wash-in-use signal for the entire time the car wash is in use. This option needs to be selected if an entry gate is being used in conjunction with the C-Start.
- Cycle Complete – The “Wash-In-Use” is normally on (voltage present). When it is given a “wash is completed” signal (no voltage present), the car wash will deactivate the “Wash-In-Use” signal for about two seconds, and it will be reactivated. If your car wash supports the “Wash-In-Use” method, you should not use the “Cycle Complete”.
- None – This handshake is used with the Start button in tunnel applications or when the C-Start is not connected to the wash controller. No reset signal will be sent by the wash controller and the C-Start will automatically reset to the welcome screen 20 seconds after a transaction is completed.

The following definitions will help you define your wash interface details:

- Relay Latching – The relay output can be either Latched or Pulsed. Checking the Relay Latching box sets the relay output to Latched. This needs to be “off” if an entry gate is being used in conjunction with the C-Start.
- Relay Stacking – When Relay Stacking is enabled, the C-Start wash interface will not send arming signals to the wash while it is in use. This needs to be “on” if an entry gate is being used in conjunction with the C-Start.
- Fault Out-of-Service (OOS) Delay – Select the amount of time, in seconds (15-300), before the C-Start displays the Out Of Service screen when a fault is detected.
- Auto Out-of-Service (OOS) Detection – Check this box to activate the C-Start’s monitoring of the out of service inputs from the wash.
- Start Button (over conveyor) – Used for Tunnel applications. While the customer is already sitting on the conveyor and after a transaction is already completed, the customer will need to press a Start button on the C-Start, causing the conveyor to start.

Wash In Use Setting (choose one)	Enable?

## C-Start Configuration Form

### Wash Product Set-up

The standard mode of operation will accommodate up to (4) wash packages. The C-Start can be configured to offer up to (8) wash packages in (2) groups of (4). The group of washes is referred to as Wash Type and the consumer must first select the wash type (for example Exterior Wash only or Bundled Wash Packages).

**Wash Packages** (List in the order it will displayed on the screen from left to right).
