

ODBC Module®

Create Custom Reports with SiteWatch® Data

Software Add-on 

Take Advantage of Your SiteWatch Data

Your SiteWatch point-of-sale system collects sales and labor data, as well as key customer information. If you have multiple locations, the SiteWatch Replication feature keeps all that information flowing smoothly between your sites and your office.

The Open Database Connectivity (ODBC) Module allows you to create custom reports using that data. The ODBC Module works with many ODBC-compliant applications, such as Microsoft Office, and comes with example queries you can modify to suit your needs.

- Access more than 70 of the most popular and useful SiteWatch tables
- Import SiteWatch data directly into other applications, eliminating error-prone manual entry
- Import customer data, such as name, address, phone number, etc., from other data sources into SiteWatch
- Create your own application that reads the data. For example, you could create an automated application running each night that analyzes merchandise sales information and faxes a purchase order to your vendor.
- Prepare for new SiteWatch releases with the User Guide, which lists the database changes from one release to another
- Keep data safe with read-only access and password protection
- Allow multiple users

Features

- A read-only user ID for accessing the SiteWatch database
- 20 Microsoft Access queries
- One Microsoft Visual Basic application
- Layouts and relationship diagrams for more than 70 SiteWatch tables
- Listing of database changes from the previous version
- Wizard for importing customer data

System Requirements

- ODBC compliant data access application if you want to extract or export data
- Microsoft Office must be at a current version If you want to use the Samples and Examples
- ODBC-compliant applications to access the SiteWatch database
